You must install a mobile app on your Android and the client software on your PC.Turn on developer mode and enable USB Debugging.The PC and phone must be connected to the same Wi-Fi network for a wireless connection. This article will explain how to use your Android phone as a webcam on your computer. While many laptops, tablets, and 2-in-1 computers come with a webcam built-in, it's not the case for desktop computers. It means either you must purchase a webcam separately, or you will need to use a comparable device to set up a makeshift video camera. One way is to use your smartphone and its built-in camera. You can connect your Android phone to your computer, using either a wired or wireless connection, which then allows the computer to access your phone's camera. You can also choose between your device's front or rear camera. If you intend to use a wired connection, you'll need the proper USB cord to connect your phone and computer.If you're planning to use a wireless connection, you will need to ensure the phone and computer are connected to the same network.You need to install an app on both the phone and computer. Unfortunately, there is no way to set up a stable connection between your computer and your Android phone without using a third-party app. The good news is you have several options when connecting your phone. While most apps utilize a wireless connection, requiring your phone and computer to be on the same Wi-Fi network, some will also allow you to connect by plugging in a USB cable. You can connect your phone to your computer using a compatible USB cable, so you can access the camera feed. Using a USB cable also keeps powering flowing to the mobile device. Before we begin, there are a few things to note: The app we recommend using is DroidCam. DroidCam includes free and paid versions. The free version allows low-quality video connections, but works just fine. With everything set up, now you can connect your Android phone and use it as a wired USB webcam. Here's how to access the phone's camera on your computer: On your Android phone, ensure USB Debugging is turned on in Settings > Developer Options > USB Debugging. Open the DroidCam mobile app (on your phone). It will ask for permission to access your device camera and microphone. Tap Allow for both prompts. Before connecting the computer and phone, tap the camera icon in the top right (of the app) and choose Front for the front camera. If you do not do this, you will see the rear camera when the connection is active. Start the DroidCam client software on your computer, and then connect a compatible USB cable to your phone and PC. You will see a notification pop-up on your phone asking for permission to Allow USB Debugging. Tap Allow. In the desktop application, click the USB icon to connect your phone with a USB cable. Also, make sure the boxes next to Video and Audio are ticked. You should see the name of your device in the connection field. If you do not see it, you may have to hit the refresh button and then select it in the dropdown. When you're ready, click Start. It may take a few seconds for the applications to sync, but you should see your camera feed on your computer once the connection is successful. Once connected, your computer will continue displaying the camera feed from your phone, and you can select the camera in video apps. The display will eventually turn off on your phone to preserve power, but the camera feed will remain active. You must always launch the DroidCam mobile app and software, and connect the feed, before starting any conferencing or video chat tools, like Zoom. Otherwise, the conferencing software will not recognize the external camera. Using the same application(s), you can also connect your phone to your computer over your home Wi-Fi network. Granted, both your computer and your phone must be connected to the same network. If you don't want to use a USB cable or wired connection, you can always sync the computer and phone wirelessly over Wi-Fi. Both devices must be connected to the same local network. Here's how to show the phone's camera feed on your computer: Whether you are connecting via USB (wired) or wirelessly, steps 1-3 are nearly identical. You may not have to repeat the process if you've done it already, such as when you're giving the app permission to access your camera and mic. Always start the DroidCam mobile application first. Give the app permission to access your camera and microphone if requested. Tap Allow for both prompts. If you've already done this before you shouldn't have to do it again, and may skip this step. Before setting up the Wi-Fi connection, tap the camera icon in the top right (of the app) and choose Front for the front camera. If you do not do this, you will see the rear camera when the connection is active. Start the DroidCam desktop client. Leave the first option (a Wi-Fi icon) selected. In the mobile app (on your phone), you will see IP and port information labeled as WiFi IP and DroidCam Port. Enter the information exactly as shown in the respective fields on the PC client. Make sure the Video and Audio fields are also checked. Then click Start when you're ready to connect. It may take a few seconds for the applications to sync, but you should see your camera feed on your computer once the connection is successful. Once connected, your computer will continue displaying the camera feed from your phone and you can select the camera in video apps. The display will eventually turn off on your phone to preserve power, but the camera feed will remain active. Be sure to prop your phone up on a stand so the video is stabilized! You might also consider installing some better lighting or using a selfie ring light. FAQ How do you use your phone as a webcam for Twitch? On your Android device, download the CamON Live Streaming app, then launch the app, select the camera you want to use, and choose your feed quality. Using a browser or media source, import the feed into your broadcasting software, then follow your broadcasting software's prompts. How do I use an iPhone as a webcam? To use your iPhone as a webcam, you'll need to download the EpocCam app to your iPhone, then launch the app and allow it to access your mic and camera. On your Mac, download the EpocCam app from the Mac App Store, then launch the app. Make sure your Mac and iPhone are on the same Wi-Fi network; they'll connect automatically, and you'll see the live feed from your iPhone on your Mac. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! By Harvey Birdman i Comstock/Comstock/Getty Images Syncing your computer with your Android phone is a great way to get your music from your computer to your new smart phone. The syncing will also allow for the Android smart phone to be constantly updated with any new music every time you hook the Android smart phone to the computer. All you need is a USB cable, a few clicks of the mouse and how much time it takes for the music files to be transferred to your Android smart phone. Turn on your computer and Android phone. There will be a power button on the front or side of the Android phone depending upon the model and carrier. The computer will have a power button on the front as well. Wait for both to go through their startup procedures before advancing to the next step. Plug a USB cable into the USB port on your computer. Then plug the other end of the USB cable into the Android smart phone. Some models of Android smart phones will have the USB port behind a rubber seal. If so, peel the seal back with your finger nail and slot the USB plug into the port underneath. Click "USB Storage Device" when you computer prompts you with a pop up menu. Even though you will be syncing the phone via Windows Media Player later, you must first authorize the phone to act like a store device. The Android smart phone will then appear as a drive icon on your desktop. Double-click on your Windows Media Player icon in your Start menu. Click on the "Sync" tab on the top, this will display a list of phones currently attached to the computer. There should be none at this point. Click the white box and then select "Set Up Sync" in the drop-down menu. Type in the name of the Android smart phone (you named the phone when you first set it up). Click "Finish" and then wait for the Windows Media Player to inventory the music database on the phone. Synchronize the music between the computer and the Android smart phone. Do not disconnect the phone while it is transferring or it could corrupt the music file. If you do have to disconnect the phone, reconnect it and re-sync the Android smart phone as soon as possible to repair the damaged files. There will be no long term hardware damage. Windows Central is supported by its audience. When you purchase through links on our site, we may earn an affiliate commission. Here's why you can trust us. A mobile operating system for smartphones and mobile devices that serves as the successor to Microsoft's initial mobile OS platform system, Windows Mobile. Unlike Windows Mobile, Windows Phone 8 (also referred to as WinPho8) and later versions are targeted more to the consumer market than the enterprise market, and it replaces the more traditional Microsoft Windows OS look and feel with a new "Metro" design system user interface. Metro's interface consists largely of a "Start screen" made up of "Live Tiles," which are links to applications and features that are dynamic and update in real time. The Metro design is also expected to be prominently featured in Windows 8 as well. As with Apple's iOS, Google's Android OS and the BlackBerry OS, third-party applications can be developed for Microsoft's Windows Phone and are made available through Microsoft's Windows Marketplace for Mobile. Microsoft doesn't enable smartphones running versions of the older Windows Mobile operating system to be upgraded to Windows Phone 7 or Windows Phone 8, and these versions also do not offer backward compatibility with Windows Mobile applications. New Features in Windows Phone 7 Windows Phone 7 features a multi-tab Internet Explorer Mobile Web browser that uses a rendering engine based on Internet Explorer 9 as well as Microsoft Office Mobile, a version of Microsoft Office that's tailored for mobile devices. An update for Windows Phone 7 called "Mango" added a variety of critical new features, including visual voicemail, third-party multitasking, a fully HTML5-compliant Web browser (Internet Explorer 9 Mobile), integrated instant messaging via Facebook and Windows Live Messenger, face-detection software capabilities, custom ringtones, threaded e-mail and messaging conversations support and more. Windows Phone 8 and Beyond Windows Phone 8 officially debuted in late October 2012, adding support for multi-core processors, a new secure "wallet" system for managing sensitive credit card and other financial data, turn-by-turn navigation capabilities, support for high-definition displays, a new Start Screen with customizable tile sizes and more. Windows Phone 8 is also based on the same core technologies as the Windows 8 operating system, sharing common networking, file system, security, multimedia and technology, including the Internet Explorer 10 Web browser. Microsoft released the Windows Phone 8.1 update, codenamed "Blue," in April 2014. The company is expected to forgo a Windows Phone 9 release, instead choosing to go with Windows Phone 10 as the official name of the next major update of Windows Phone.
