## How do i lock windows 10

Did you know that, back in the Windows 3, 95, and 98 days, you could simply type in your password to log into your computer? It sounds crazy, I know, but it's true. Since Windows XP, the process has become steadily more convoluted — picking your avatar from a list, or hitting Ctrl+Alt+Del before being allowed to log in (this was actually a security feature, believe it or not). Windows 8 is the worst offender yet, positively spitting in the face of keyboard users — but fortunately, it's quite easy to disable the new Windows 8 lock screen. In essence, the new Windows 8 lock/login screen is meant to act as a dashboard, flashing up notifications for new email, IMs, and so on. On a tablet, where you swipe the lock screen away and then begin typing, this makes perfect sense. On a desktop PC, though, the lock screen is clunky (you might say this is a bit of a recurring theme in Windows 8). Yes, theoretically you only have to tap a key and it slides away, but for some reason Microsoft introduced a delay so that you can't immediately type your password. As a result, you often end up losing the first few letters of your password, waiting for Windows to tell you that your password is incorrect, and then typing your password in correctly. How to bypass the Windows 8 lock screen To remove the lock screen entirely, so that locking is just a plain password prompt — and booting up goes straight to the same password prompt — just follow these very simple steps. Hit the Start key, type gredit.msc, and press Enter. This will open the Local Group Policy Editor. Navigate to Computer Configuration > Administrative Templates > Control Panel > Personalization. Double click "Do not display the lock screen," and select Enabled from the dialog that pops up. Click OK. The change is immediate. Go ahead and press Win+L and admire your new, minimal lock screen. In addition, if you're feeling really sassy, you can also tweak your computer to boot straight to Desktop, either with Windows 8's built-in Task Scheduler, or by using a third-party Start menu replacement, most of which include this functionality as a configurable option. This way, the Desktop will be the second screen you see, instead of the fourth — neat. Check out our Windows 8 tips page for more... Windows 8 tips. With Windows 10's Anniversary Update, Microsoft no longer lets you disable the lock screen using a group policy setting or registry hack. But there are still workarounds—for now. The group policy setting that disables the lock screen is still available, but it only works on Enterprise and Education editions of Windows. Even Windows 10 Professional users can't use it. Update: Microsoft re-enabled the original registry hack. It works once again in the April 2018 Update, and possibly earlier versions of Windows 10. We recommend you use this registry hack on the latest versions of Windows 10 instead of following the below instructions. RELATED: How to Disable the Lock Screen on Windows 8 or 10 (Without Using Group Policy) How to Disable the Lock Screen (Except at Boot) Follow the instructions below and you'll only see the lock screen once: when you boot your computer. The lock screen won't appear when you actually lock your computer or it wakes from sleep. If you put your computer to sleep or hibernate it, you'll never see the lock screen at all. We've seen a variety of ways to do this online, involving everything from the Local Security Policy editor to the Task Scheduler. But the easiest way to do this is by simply renaming the "Microsoft.LockApp" system app. To do this, open File Explorer and head to C:\Windows\SystemApps. Locate the "Microsoft.LockApp\_cw5n1h2txyewwy" folder in the list. Right-click it, select "Rename", and rename it to something like "Microsoft.LockApp\_cw5n1h2txyewwy.backup" (without the quotes). If you ever want to restore your lock screen, just return to the C:\Windows\SystemApps folder, locate the "Microsoft.LockApp\_cw5n1h2txyewwy.backup" file, and rename it back to "Microsoft.LockApp\_cw5n1h2txyewwy". With the LockApp folder renamed, Windows 10 won't be able to load the lock screen anymore. Lock your computer and it will go straight to the login screen where you can type a password. Wake up from sleep and it will go straight to the login screen. Unfortunately, you'll still see the lock screen when you boot your computer—that first lock screen seems to be a part of the Windows shell. This works very well. There's no error message or any other apparent problem. Windows 10 just goes straight to the login screen because it can't load the lock screen first. Microsoft will probably break this tweak in the future. When you upgrade to a new major build of Windows 10, an update will likely restore the "LockApp" folder to its original place. You may need to rename the folder again in the future if you start seeing the lock screen again. How to Skip the Lock Screen at Boot (and Sign in Automatically) RELATED: How to Make Your Windows 10, 8, or 7 PC Log In Automatically If you'd like to get past the lock screen even when booting your computer, considering having your computer automatically sign in when you boot it up.. Your computer will automatically sign into your user account and you won't even have to enter a password when it boots. There's a potential security risk to logging into your Windows PC automatically, though. Don't do this unless you have a desktop PC located somewhere secure. If you carry your laptop around with you, you probably don't want to have that laptop automatically sign into Windows. The old netplwiz panel will let you enable automatic login on Windows 10. Press Windows+R on your keyboard, type netplwiz , and press Enter. Select the account you want to automatically sign in with, uncheck the "Users must enter a user name and password to use this computer" option, click "OK", and enter the password for your account. Windows will store it in the registry and automatically sign into your computer for you when it boots. Instructables is a community for people who like to make things. Instructables is a community for people who like to make things. Come explore, share, and make your next project with us! The Windows taskbar is positioned at the bottom of the screen by default. You can shift it to different locations by clicking and dragging it. Because it's easy to move by accident, you might want to lock the Windows taskbar into place. Locking the taskbar is recommended if more than one person uses the PC. Instructions in this article apply to Windows 10, Windows 8, and Windows 7. The Windows taskbar provides quick access to frequently used applications, important system settings, and incoming notifications. It also houses the Start menu and the Windows search box. You can customize the Windows taskbar by pinning applications, changing the language settings, and more. To lock or unlock the Windows taskbar, right-click any blank space on the taskbar and select Lock the taskbar. You'll see a check mark if the taskbar is locked. If there isn't a check mark, select Lock the taskbar once to lock it, and select Lock the taskbar again to unlock it. You can also lock the taskbar in place from the Windows settings: Right-click a blank space on the taskbar, then select Taskbar settings (in Windows 10) or Properties (in Windows 7 and 8). Set the toggle switch under Lock the taskbar to On. On Windows 8 and 7, select the Taskbar tab, then select the Lock the taskbar check box. Thanks for letting us know! Tell us why!
