How to update weather app on android

After the initial tests of May, Google has widely developed a restyling of Android's predefined weather app. A part of Google Search, the experience has been late for modernization. 9/9 update: starting today, the new Google Weather is widely available for all Android users. This includes those on stability (12.34) and beta (12.35) Google app channel. Be sure to update via the Play Store. At launch from the widget of Glance AT A, Homescreen connection icon (which Android 12 beta 5 users have to do), or research, the screen is initially white first thematization for current weather conditions. The system gesture bar remains white, but the upper part now corresponds fully. Meanwhile, you can tap the new Avatar profile for temperature unit change between Fahrenheit and Celsius, as well as A Add to homescreen. However, there is a bug in the search bar when you pass positions like a 0A, position appears and does not charge after selection. Update 9/5: Google Weather Redesign on Android has returned for some people. This current version faces the previous white status bar for thematization correctly to meet the weather conditions. Because of bugs, which was not ready again in May, but hopes that Google has developed the problems and it is widely rolled out to the sooner. It looks like the Hub and Hub Max nest are collecting on the quality of the air (AQI) cards in the United States, while a material time is expected for Android 12. It is clear if this element is linked To this weather app. Thanks Dee! Update 6/1: a week after the first appear, Google rolled the redesigned Weather App. A possible motivation is the bug related to the switching and the search for different cities. This removal has been done on the server side this morning, even if you might not notice until a lower beta update. Original 5/25: before this, Google had not touched time experience on Android for several years. This renovation brings many material theme flourishes like a search bar with rounded corners and up-to-date tab indicators for today, tomorrow and 10 days. Meanwhile, the navigation drawer was replaced by your Avatar profile in 'corner at the top right. Tapping reveals an account descent with settings to change the temperature units and an add to the homescreen connection. A rather strange aesthetic style that Google opted for this time redesign is a net white status bar which was previously theme for current weather conditions. The new color matches navigation and search bar, but it's too bright especially when the theme of the dark system is active. Google is hoped to change this in a future update as the account selection currently respects the night modes. There are no other changes the experience of forecasting core with the company still weather.com for date. At the moment there are no bugs when touching the search bar for switching cities. Your complete list of saved locations is not correctly uploading. Google App 12.20 is currently in the beta channel and the time launch from the launch pixel is in a look widget or through the search results page loads this redesign. It should be available in the stable channel as soon as possible. Information on Google Search: FTC: 9To5Google is supported reader, we can earn an affiliate income linkscheck outside 9To5Google on YouTube For more information: Applicable Products Tablet Smartphone If the Weather application does not update weather information automatically or when scrolling towards the low on the home application screen, or the Weather displayed is indicated as obsolete, try the following to solve problems: Open AppGallery, search for Weather and make sure the application is updated. If no update can be found, time is until today. Open settings, search and access access to location, enable my location access, and together the location mode to use the GPS, Wi-Fi and mobile networks. Location mode is only available in emui 8.x and previous versions. If you are using a Wi-Fi connection, go to mobile data to check if this resolves the problem. If if This problem may have been caused by a low Wi-Fi connection. If you use mobile data, go to a Wi-Fi network to check if this resolves the problem. Otherwise, the problem can be caused by some limitations placed by the courier. Please contact your courier for more information. Delete the time app data and add your city / location again by doing the following: Open the settings, search and access the apps and go to. Emui 8.x and earlier: the open time, touch the upper left corner and touch Add City.emui 9.0 / Magic UI 2.0 or later: the open time, touch the upper right corner, tap Manage the City and touch Add City. Back up your data and take your device and purchase test at an authorized Huawei customer support center for assistance. Sorry for any help. Select the following methods to get more support: Thank you for your feedback. Joe Hindy / Android authority authority with time is something we all need to know. Weather apps for smartphones and meteorological widgets have been constantly improving over the years and are better than they have never been. They work better, have more detailed and accurate information, and meteorological widgets generally seem better and more modern. These days, you can get some crazy radar, even if the dark sky doesn't exist more on Android. There are a lot of great options, but we think we encounter the best of the best. Here are the best weather and weather widget apps currently available on Android.1weather by Onelouder Apps for a long time and is not just one of the most popular weather apps on this list, but also one of the most listed. Comes with your standard features like your daily and time forecasts along with access to more information. There are also some available weather widgets. The design is crisp and clean. It is also supplied with the support for Android wear, time monitoring for a maximum of 12 cities and has a support for 25 languages. All the features arrive in the free version with advertising. You can also pay \$ 1.99 to remove advertising. The only problem we've ever had with this is the radar that refuses to load on the occasion. Price: free / \$ 2.99 / \$ 8.99 per montheculweather from AccuWeather.com is one of the most popular and good apps. Presents the bases, including extensive forecasts, hourly forecasts and the like. Other features include radar, some of the best operating system supports of any weather app and more. It also includes a petite function. It includes rain based on minute minute so you can plan your day a little easier. The app suffered a 2020 re-design and introduced a group of new bugs that was still repaired. However, it should improve next year while iron everything. Furthermore, the service has a subscription service for some users. We take an eye on this and re-evaluate when we update the next to see if it must remain in the list. Price: free / \$ 3.99 For Thereppy Weaer is the last weather app on the list, regarding speaking. It has a group of features and that includes most of those that every weather app has. Some of its most unique features include a much more personalized feed in most, a fun and fashionable user interface and the climate. Use the SKY DARK SKY API for now, but it should have other options in the near future. The subscription is quite reasonable at \$ 3.99 a year. It has some bugs here and there, but a front option quickly for many. Google Assistant is not one of the usual weather apps. It can show you the
