Bcdedit user guide

The Boot Manager in modern versions of Windows uses the BCD file (Boot Configuration Data) to start the operating system installed on your computer. This file contains information about the installed operating system and the startup parameters. Windows cannot normally start if the BCD file is deleted or damaged. Also, you will not be able to start Windows if the Mater Boot Record (MBR) on your hard drive is damaged. In this article, we will show how to manually rebuild the boot configuration file (BCD) and fix MBR on Windows 10. If the BCD file is missing or damaged, if you have removed/formatted a separate disk partition with System Reserved label (and 500 MB size) or a special OEM recovery partition, a user is likely to see the following message when you try to start Windows 10: Your PC must be repaired The Boot Configuration Data file lacks some information required File: \Boot\BCD Error Code: 0xc0000034 In addition, the error can resemble this: The boot configuration data for your PC is missing or contains errors. File: \boot\bcd Error Code: 0xc000f If the MBR is damaged, there may be a "No operating system found" error. How to Repair Bootloader automatically in Windows 10? If this error appears, first of all, try to fix the problem with booting the operating system using the boot repair mode that can be started by Windows Recovery Environment (Windows RE). If auto repair using Startup Repair did not help, start the computer from Windows startup/install disk or inenvironment (Repair of the computer -> Troubleshooting -> Advanced options -> Command Prompt.) Launch the command prompt and try to create a new BCD file and update the MBR record from scratch. In this example, I will use the Windows 10 installation disk. Change the primary boot device to a DVD or USB flash drive in the BIOS settings (depending on the device from which you want to start your computer.) Launch the computer from the Windows installation image and press Shift + F10 on the language selection screen. You'll see a command prompt. Try to restore the BCD file automatically using this command: bootrec /RebuildBCD Restart your computer and check if Windows boots (don't forget to change the boot priority settings in BIOS.) If it is not, start again from the installation disk and start the command prompt. Identify disk partition style and very important drive letters. All instructions below are suitable for standard BIOS computers with MBR partition table. For UEFI-based computers, you need to use the following guides to repair bootloader in Windows 10/8 with EFI or Windows 7. How to understand if you have a computer with BIOS or UEFI? The easiest way is to check the disk partition table on which Windows is installed: GPT or MBR. To do this, run the command: diskpart Then list the available disks: Disk list If the disk has an asterisk (*) in the Gpt column, the GPT partition table is used on this disk (this means you have a computer with UEFI and you needthe article from the link above to restore Windows bootloader). If there is no asterisk in the GPT column, then you have the MBR partition table on the disk, and you can continue to follow this instruction. Next, you need to identify local drives and volumes on your computer (most likely the assigned volume letters will be different from those you see when working in Windows). It's easier to do it using diskpart. Run these commands: diskpart list vol You will see the partition list, drive letters assigned them and their size. In our case, there is a hard drive on the computer with the two volumes on them: System Partition Reserved with the size of 500 MB and the letter of unit C: assigned to it. By default, the BCD file is located in this small service partition (read more); NTFS partition with the size of 39 GB and the letter D: assigned. This partition contains Windows installed, programs and user data. Repair Master Boot Record (MBR) in Windows 10 Using the following commands, we overwrite the Master Boot Record on the hard disk boot sector, and add the necessary links for Windows 10 bootloader. bootrec.exe /fixmbrct.exe /nt60 everything /force If you boots. exe command is not found, try to specify the full path to it: X:\boot\bootsect.exe /nt60 all /force How to manually rebuild Boot Configuration File on Windows 10? Then using the BCDedit command, create a new Boot Configuration Data file (it is supposed that you do not have the BCD fileDelete the old (corrupt) BCD file in the reserved partition of system and create a new one instead: of the c:\boot\bcd Create a temporary empty file bcd.tmp: bcdedit /createstore c:\boot\bcd.tmp Create a voice for Boot Manager (bootmgr): bcdedit.exe /store c:\boot\bcd.tmp /create {bootmgr} /d "Windows Boot Manager" Import settings from bcd.tmp to your BCD: bcdedit.exe /import c:\boot\bcd.tmp Specify that the Boot Manager is on the System Reserved partition (the letter C: is assigned): bcdedit.exe /set {bootmgr} partition=c device: Configure the timeout to select an operating system: bcdedit.exe /timeout 10 Delete temporary file: c:\boot\bcd.tmp So we have a file with the bootloader parameters. Now you need to add items about the installed Windows. Create a new entry for Windows 10 in the BCD configuration: bcdedit.exe /create /d "Windows 10" / application osloader The command will return the unique identifier (GUID) of this bootloader. The entry {8a7f03d0-5338-11e7-b495-c7ffbb9ccfs} was successfully created. Specify that bootmgr must use this item by default (after the timeout, this entry is used to start): bcdedit /default {8a7f03d0-5338-11e7-b495-c7ffbb9ccfs} Now you need to specify the paths to the installed copy of Windows 10 in the new bootloader entry. We saw in WinPE that the D letter: is assigned to the Windows partition. Use this drive letter in the following commands: bcdedit.exe /set {default}device partition=d: bcdedit.exe /set {default}partition=d: bcdedit.exe /set {default} path \Windows\system32\winload.exe bcdedit.exe /set {default} systemroot \Windows Make visible this boot record in BCD, since it is hidden by default: bcdedit. exe /displayorder {default} /addlast So we re-created Windows 10 bootloader and BCD file, and fixed the boot sector on MBR. Now you can restart your computer and make sure that Windows 10 boots as usual. The usual.
